                                                                              A variant of the human papilloma virus (HPV) 86 or 87 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length 86 or 87 protein starting from the N- or C- terminal, or is a full length 86 moiety fused to a full length 87 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a full length 86/87 fusion protein. (Updated on 27-AUG-2003 to correct OS

                                                                                                                                                                                                   AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours

                                                                                                                                                                         This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked t an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyra protein (CLyra) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the
Composition comprising induce immune response

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                   This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the streptococcus pneumoniae CLYTA protein. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAX78791-X78801 represent nucleic acid sequences which encode novel constructs compxising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for
                                                                                                                                                                                                                                                                                                     Disclosure; Fig 10; 95pp; English.
                                                                                                                                                                                                                                                                                                                                                        Human Papilloma Virus (HPV) fusion proteins - useful in vaccines for treatment or prophylaxis of HPV induced lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bruck C, Cabezon Silva Lombardo-Bencheikh A;

                                                                                                                                                                                      The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warte and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLYLA) or thioredoxin. The present

                                                                                                                                                          CC The invention concerns transgenic non-human animals that express CC concogenes of interest in their epithelial cells, and materials and CC methods for their production. Expression of the oncogenes is controlled CC by a sequence from the human involucrin upstream regulatory region (see AA09476) which targets expression to desired tissues and cells (i.e. CC suprabasal stratified squamous epithelial tissue). The transgenic animals CC are useful as animal models for studying neoplastic diseases that affect CC epithelial tissues, such as those caused by the papillomavirus 16 CC oncogene E6 or E7 mucleic acid sequences and including blast affect CC optimises (e.g. epidermolytic hyperkeratinosis, Dowling-Meara disease), CC groliferative diseases (e.g. psoriasis, epidermal lysis and Bulosa CC simplex), ichthyosis disease (e.g. Ichthyosis bullosa Simens and CC colon, cervix and liver. The animal models may also be used to screen CC candidate agents for the ability to prevent or treat these diseases

The invention cells containing it, are used in treatment and prevention of cervical cancer, particularly as a vaccine. By selecting the nucleic acid that encode E6/E7 proteins without ability to bind to pRb and p53, the risk that cells infected with the alphavirus vector system may become oncogenic is avoided (contrast use of other viral vectors). The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New alphavirus system, useful for genetic cancer, comprises papilloma virus nucleic
                                                                                                                                                                                                                                                                                                                                                       24-OCT-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Obtd. by cutting HPV16 with BamHI and PV1II. The patent describes probes (DNA or RNA) and their complements capable of detecting one or a combination of HPV types 6, 11, 16, 18, 31, 33 and 35. (Updated on 25-MA) -2003 to correct PR field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                     AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce at immune response in a patient to an HPV antigen. They can also be used i preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1005 BP; 325 A; 182 C; 190 G; 308 T; 0 U; 0 Other;

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the
                                                                                                                                                                                                                                                              Pusion protein; E6 protein; E7 protein; E6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment; ss.

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce ar immune response in a patient to an HPV antigen. They can also be used f

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                       The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) B6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae LyCA protein (CLyCA) or thioredoxin. The present sequence encodes an HPV-LyCA, fusion protein of the invention.

The ribozymes cleave HPV to lower the production of the E6 and E7 proteins which play a key role in keratinocyte transformation. They can be used for the treatment of HPV infections which are associated with genital warts and genital neoplasms. In particular they can be used for the treatment of cervical cancer optionally with other agents such as cisplatin. Ribozymes are described in AAT40306-T40315. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC developing cervical dysplasia or cervical cancer. The methods involve:

CC (1) preparing a cervical sample to expose any HPV-16 E6 gene in the

CC sample and determining if the base at position 350 of the E6 gene (see

CC AAT94723 and AAT94724 for comparison) is T or G, where the presence of G

CC at position 350 is associated with an increased risk of developing

CC cervical dysplasia or cervical cancer; and (2) preparing a cervical

CC sample to expose any HFV-16 E6 protein in the sample and determining if

CC the amino acid at position 83 of the protein (see position 90 in AAW35741

CC and AAW35742 for comparison) is Val or Leu, where the presence of Val at

CC correlates well at is associated with an increased risk of developing

CC cervical dysplasia or cervical cancer. The present sequence represents

CC the variant nuclectide sequence for HPV-16 E6. The 350G variant

CC correlates well with Pap scores; 350T:350G ratios among 45 HFV16 samples

CC were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for

CC CIN III; 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Methods have been developed for distinguishing a subset of human comparison virus (HPV) that is associated with an increased risk of developing cervical dysplasia or cervical cancer. The methods involve: (1) preparing a cervical sample to expose any HPV-16 E6 gene in the comparison and AAF94724 for comparison) is T or G, where the presence of G cat position 350 is associated with an increased risk of developing cervical dysplasia or cervical cancer; and (2) preparing a cervical for comparison) is T or G, where the presence of G cat position 350 is associated with an increased risk of developing cervical dysplasia or cervical cancer; and (2) preparing a cervical for sample to expose any HPV-16 E6 protein in the sample and determining if the amino acid at position 83 of the protein (see position 90 in AAW35741 cand AAW35742 for comparison) is Val or Leu, where the presence of Val at position 83 that is associated with an increased risk of developing cervical dysplasia or cervical cancer. The present sequence represents the reference mucleotide sequence for HPV-16 E6. The 350G variant the reference mucleotide sequence for HPV-16 E6. The 350G variant correlates well with Pap scores; 350T:350G ratios among 45 HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for CIN III; 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)

This invention relates to antisense oligonuclectide analogs (ONs) that have a sequence complementary to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-16). The antisense ONs can be used to inhibit expression of HPV gene E6/E7 in living cells, preferably human keratinocytes or human cervical cells. They bind to E6/E7 mRNA in the cell, prevent mRNA translation and promote mENA degradation by intracellular RNase H. They can be used for preventing transformation of living cells by HPV. The antisense ONs are used particularly for inhibiting the growth of cervical tumours. (Updated on 17-OCT-2003 to standardise OS field)

musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number

The resulting fragments we between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mpl9, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored DNA was annealed to adaptored vector DNA, and transformed DNA was chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                             /note=Torgan: embryo; Vector: pBluescript SK-; Site 1:
ECORI, Site 2: KhoI; Library was prepared from 50 ug of
total RNA by oligo-dT priming and AMV reverse
transcriptse. After addition of EcoRI linkers and
ECORI-XhoI digestion, the CDNA was size selected by
chromatography on Sepharose CL-48 columns and fractions
containing cDNAs larger than 500 bp were ligated into
ECORI-XhoI-digested lambda ZAPII (UniZAP-XR) and packaged
in vitro. Average insert size is 1.4 kb. The original
library contained 6 x 106 recombinants, of which 3 x 106
were amplified and stored at -70 C in SM buffer containing
7% DNSO. 3 x 106 pfu were mass excissed and the resulting
phagemids used to infect Topp10F. References: Science 253,

Rice blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous ascomycete with
a haploid genome (n=7) of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fungal-host interaction. In
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         organism="Magnaporthe grisea"
